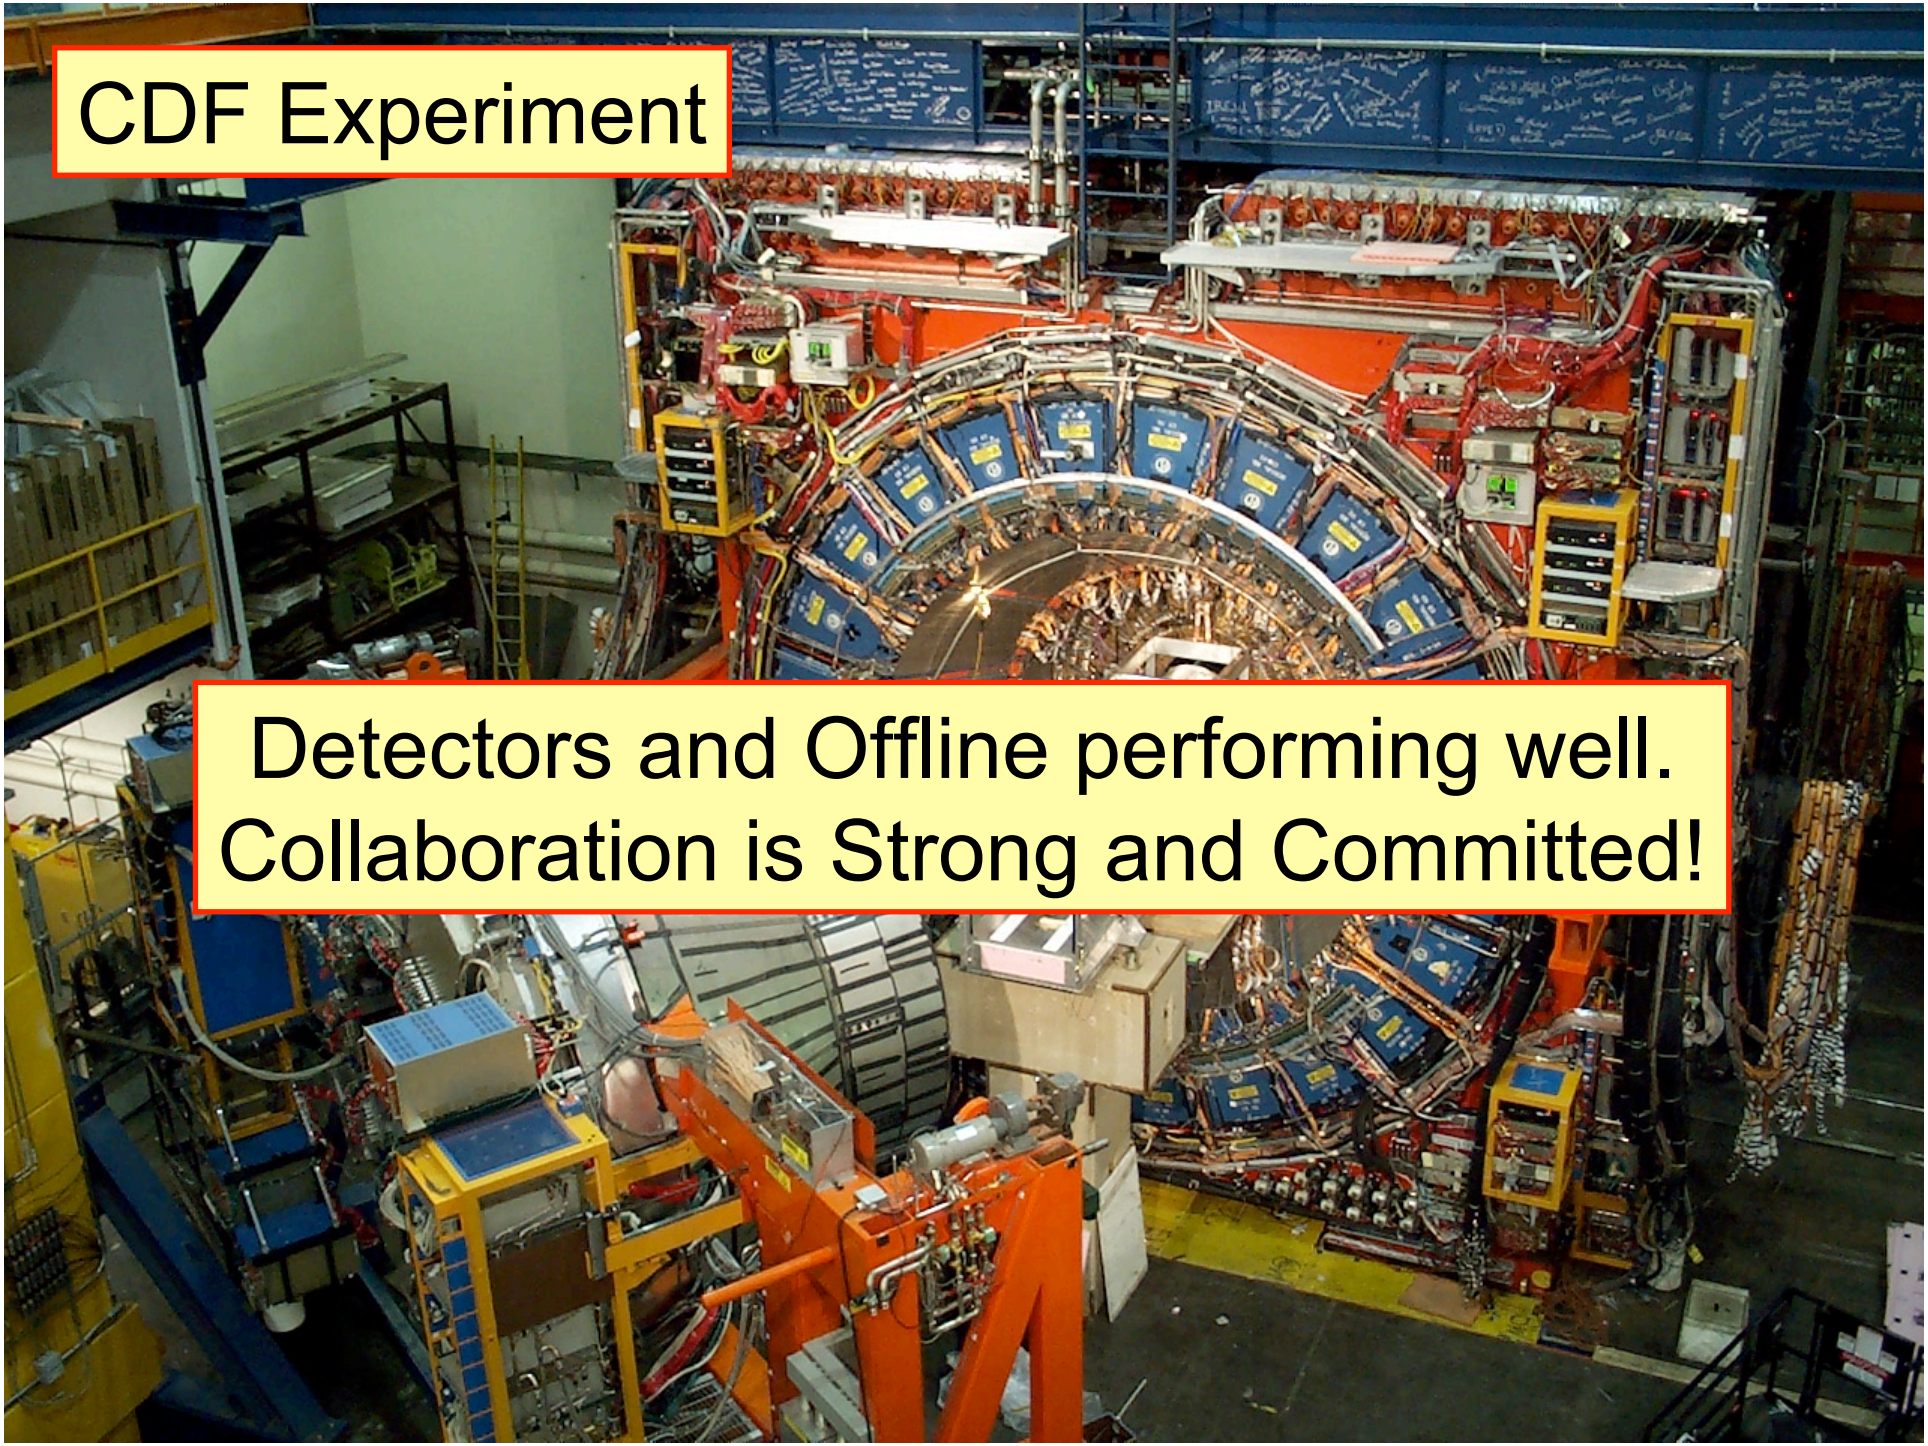
Physics: Highlights and Projections
(Young-Kee Kim)

The Challenge of High Luminosity and Shrinking Resources
(Rob Roser)



CDF Experiment
Detectors and Offline performing well.
Collaboration is Strong and Committed!

CDF II Physics Results

http://www-cdf.fnal.gov/physics/pub_run2/

Physics Papers	2001	First Collisions,Commissioning
	2002	First Physics Data
	2003	4
	2004	17
	Dec 8, 2005 Dec 9-23, 2005	29 7
	Total	57
NIM Papers	Total	31

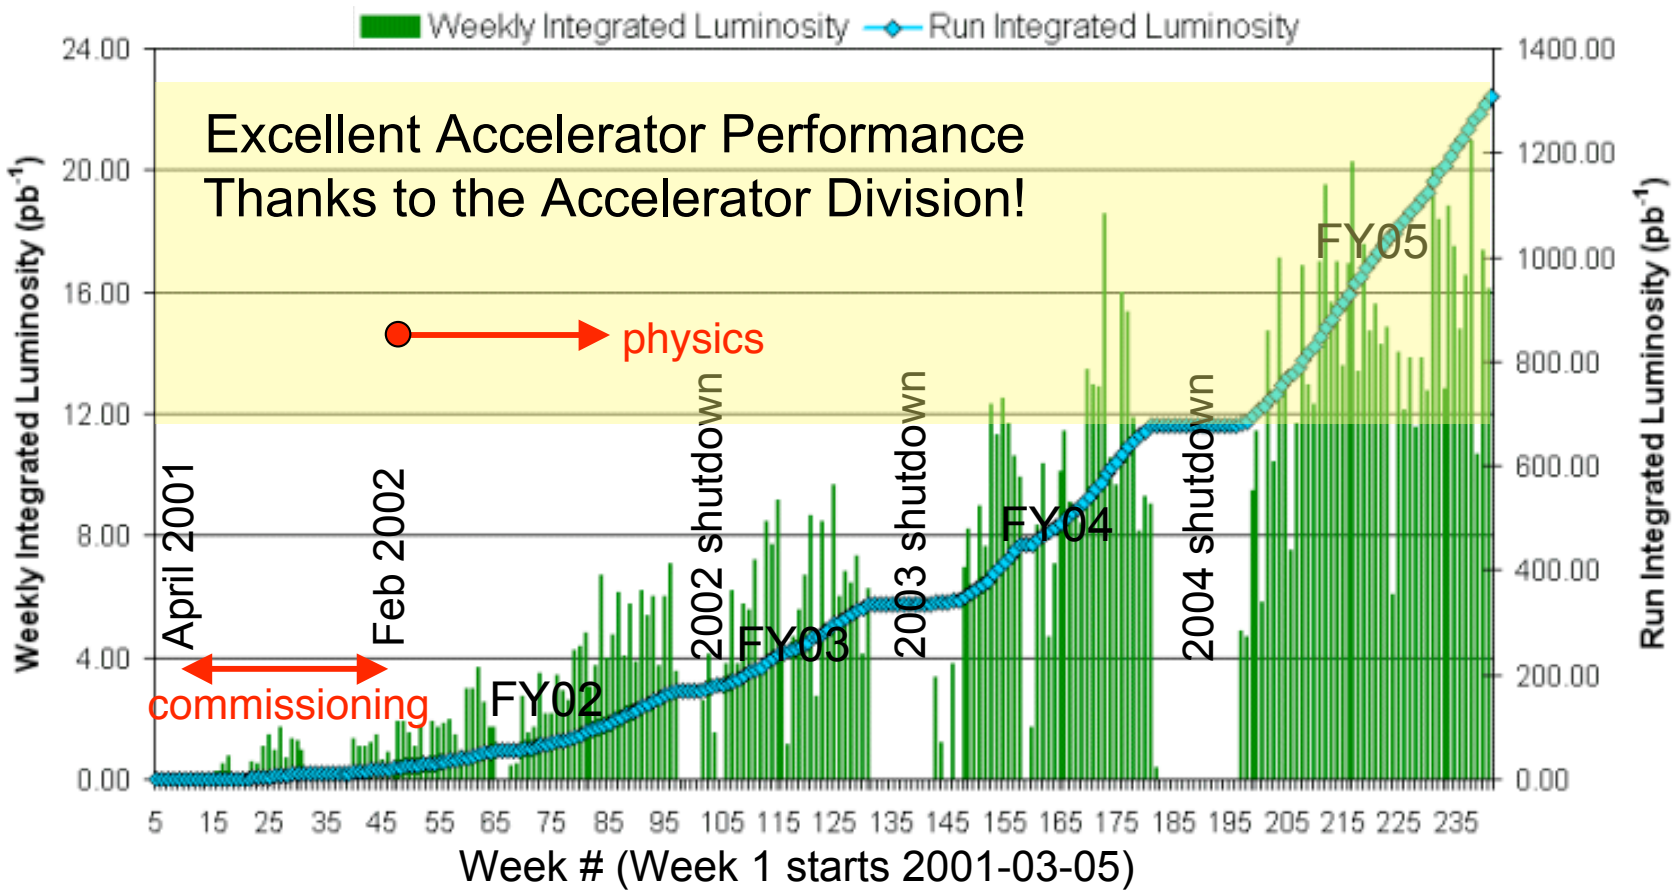
35 physics papers currently under collaboration's review

See the details in the backup slides.

Today's presentation includes some (not all) of the new results.

the others results - http://www-cdf.fnal.gov/physics/physics.html

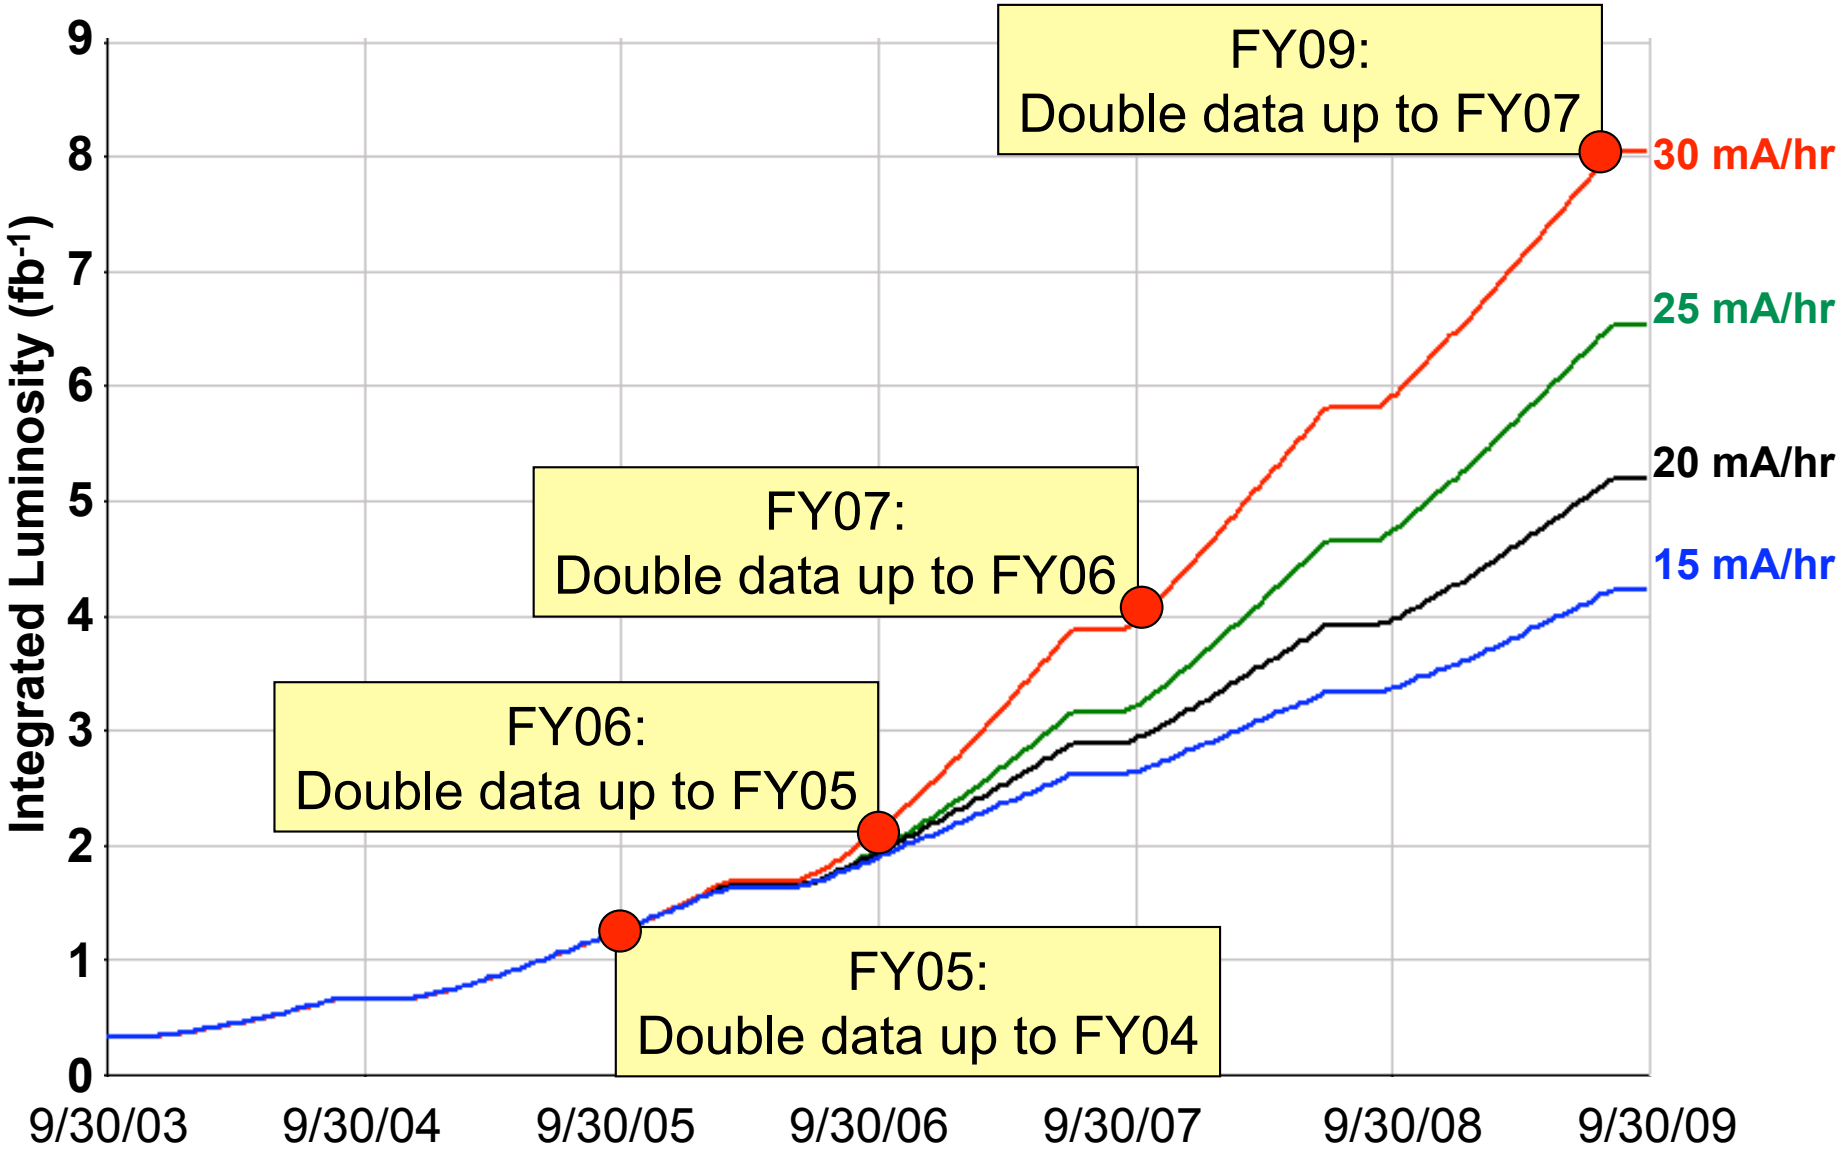
Data delivered/recorded to date



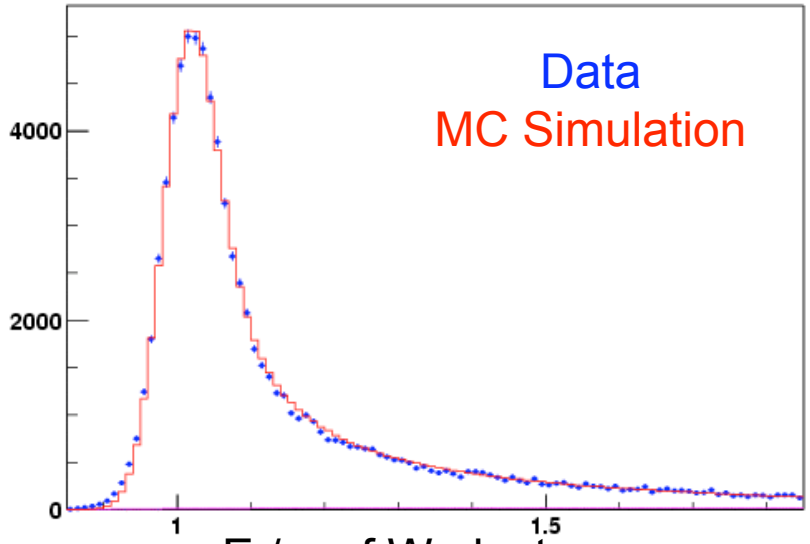
CDF: 1.44 fb^{-1} delivered, 1.15 fb^{-1} on tape
(80% data taking eff.: 20% ineff. includes ~5% Trigger/DAQ dead time)

1.0 fb^{-1} good for physics without silicon, 0.9 fb^{-1} good for physics with silicon

Projected Data Sample Growth

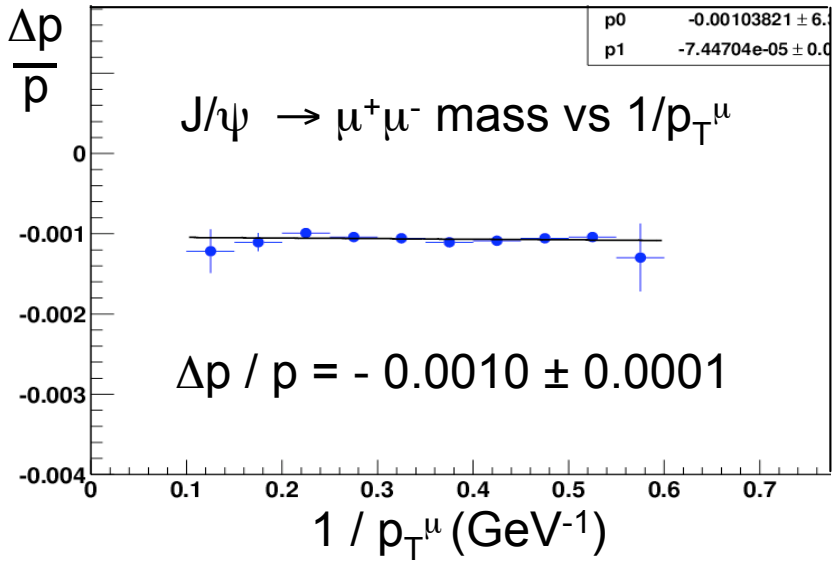


Momentum and Energy Scale Status

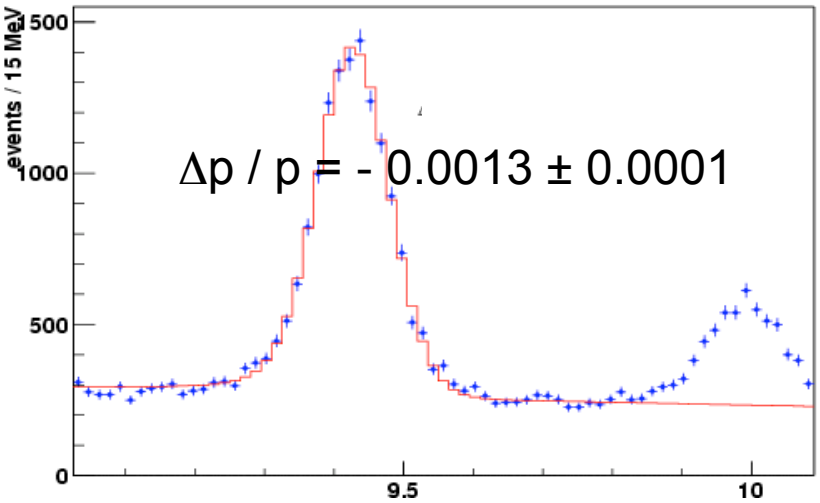


E / p of W electrons

- Understand passive material well:
  - E/p tail - data vs. simulation
  - Flatness of $J/\psi \rightarrow \mu^+\mu^-$ mass over a large p_T range
- $\Delta M_{J/\psi}$ = 0.05 MeV, ΔM_B = 0.2 MeV
- ΔM_W due to P, E scale
  - Run II current (Run Ib)
  - μ: 30 (87) MeV, e: 70 (80) MeV
  - better than Run Ib



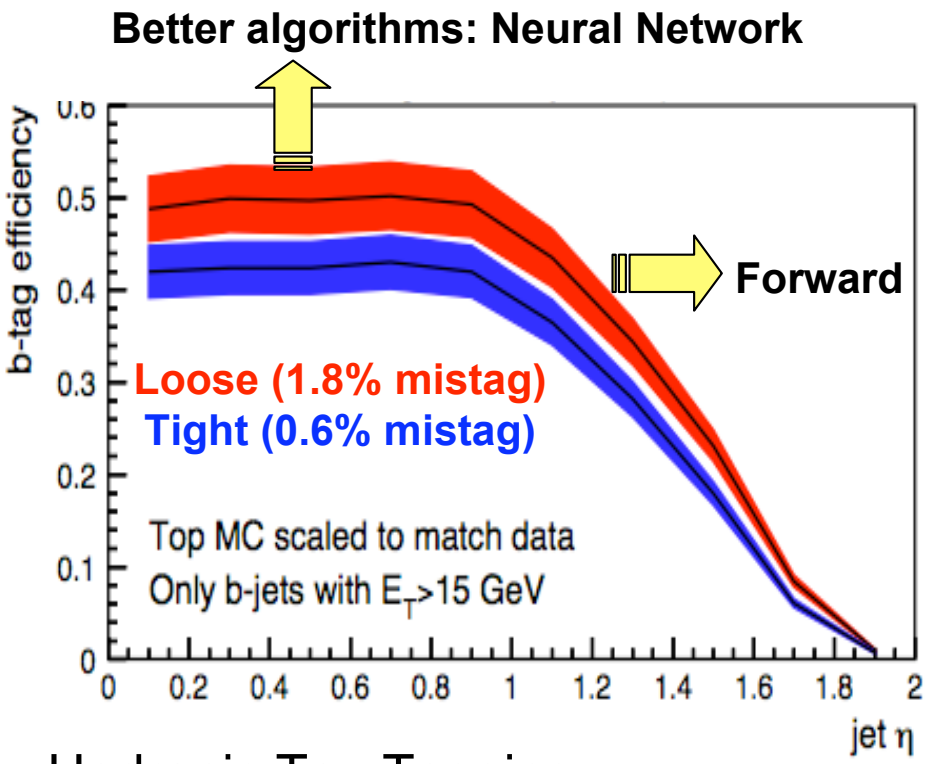
1 / p_T^{μ} (GeV^{-1})



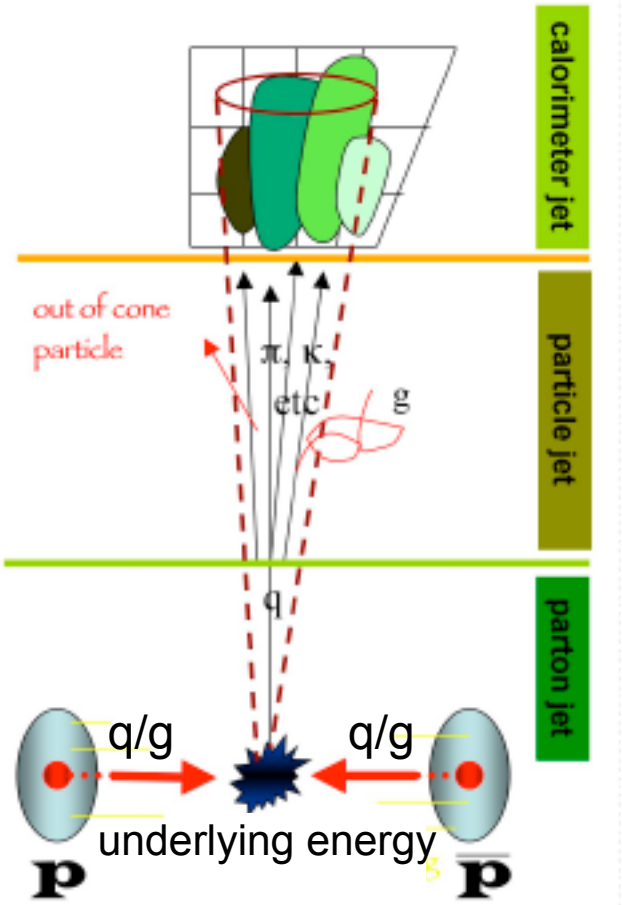
$\mu^+\mu^-$ mass (GeV) near Upsilon

Tagging and Jet Energy Calibration

- B Tagging (secondary vertex)



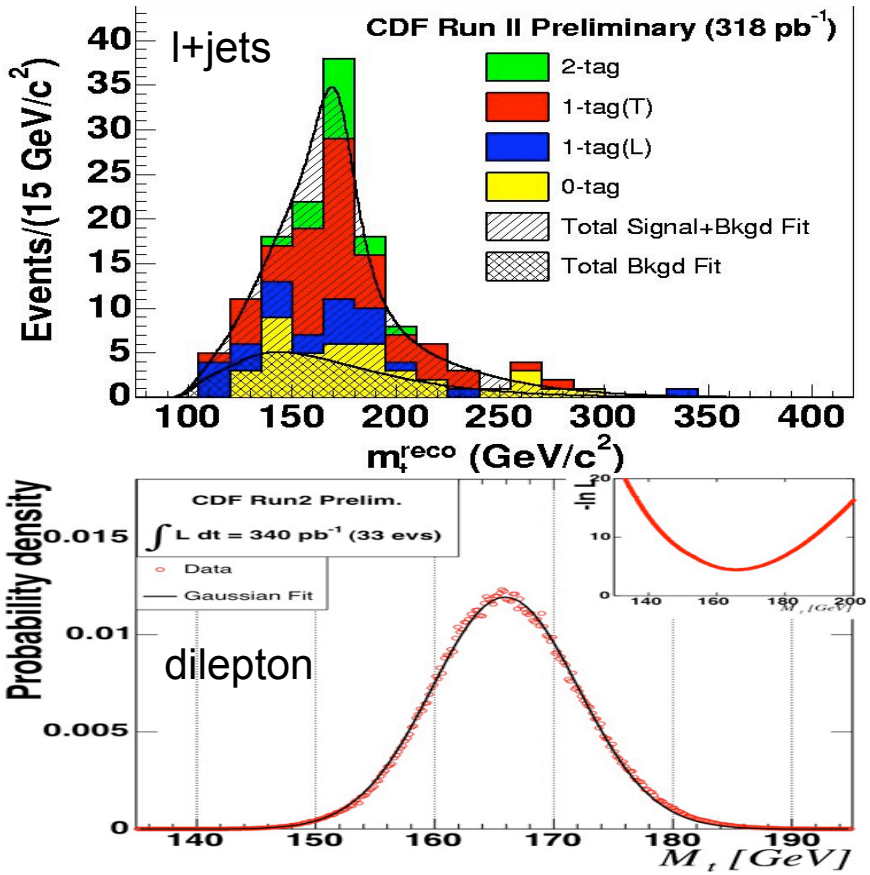
- Hadronic Tau Tagging
  - $E_{visible}$ > 30 GeV
    - ~50% efficient
    - 0.5 - 0.1% mis-identified

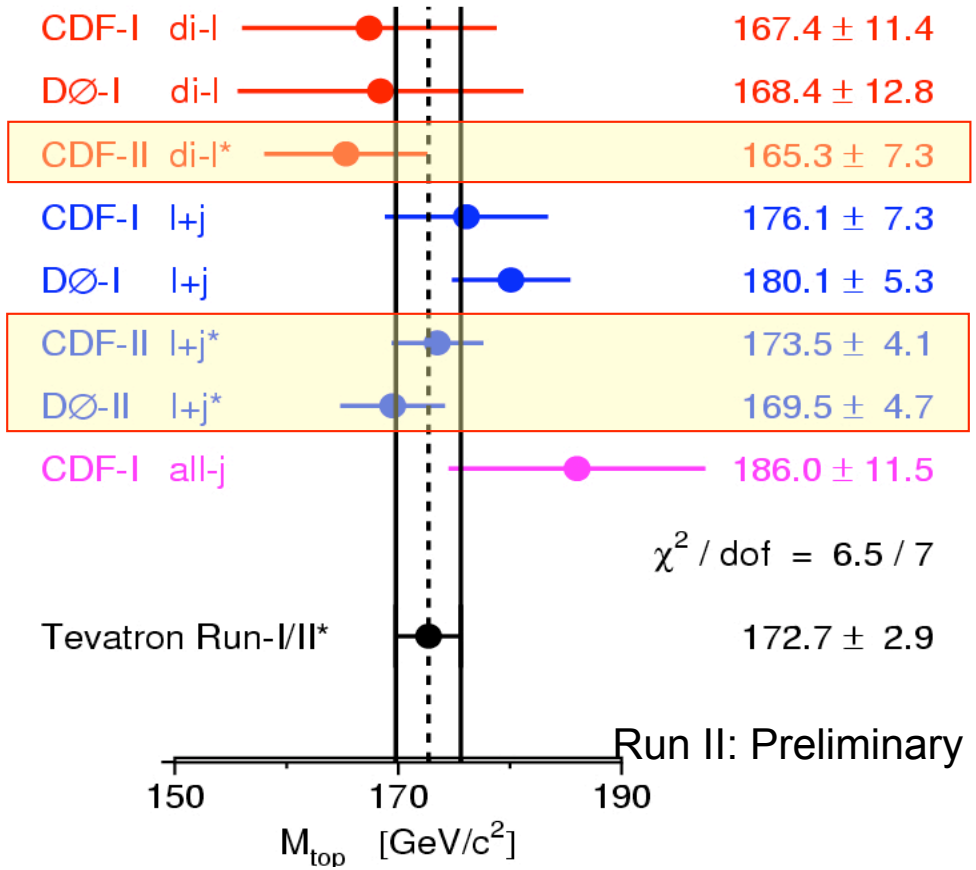


$\Delta E_{jet}/E_{jet}$ 3.5% at 50 GeV
2.6% at 100 GeV
2.8% at 200 GeV

About to submit to NIM: hep-ex/0510047

Top Mass Measurements

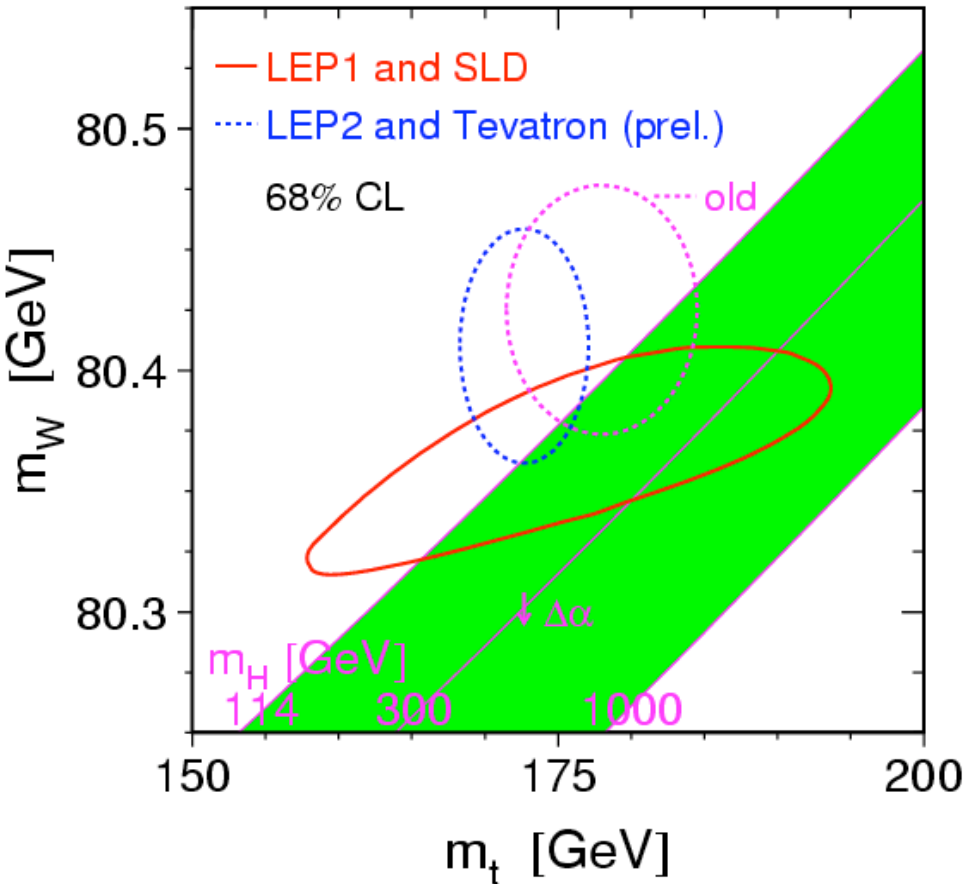


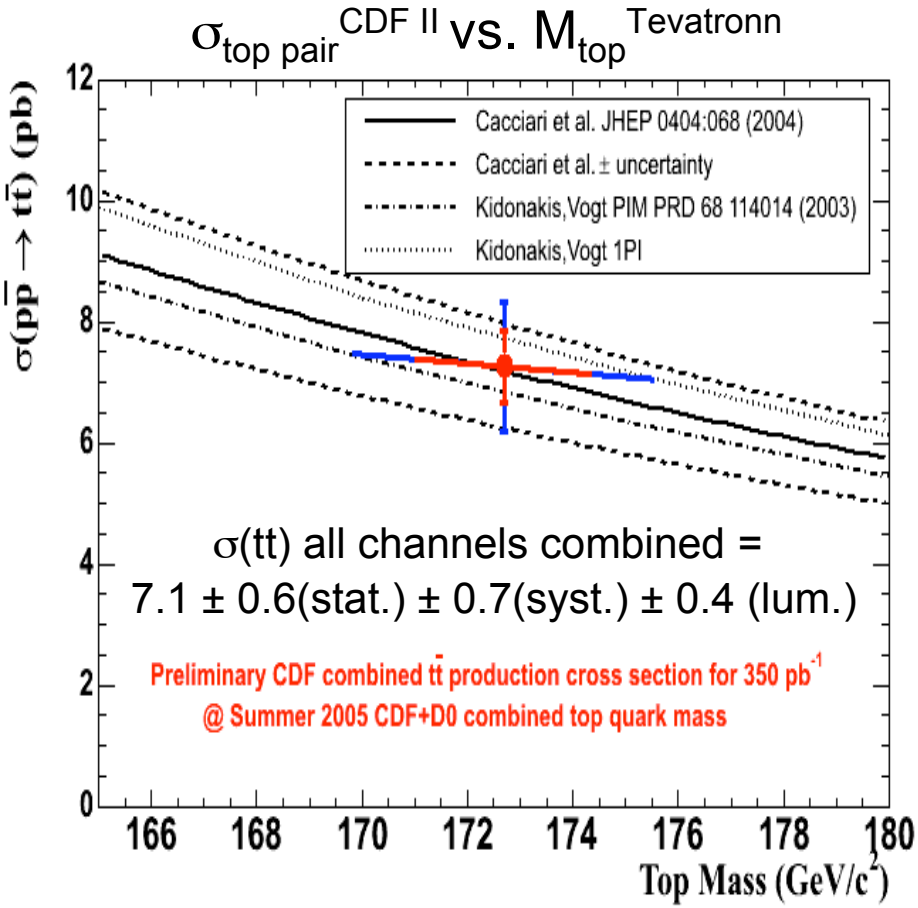


- lepton+jets (2 methods): 3 papers accepted/submitted
  - $173.5\ ^{+3.9}_{-3.8}$ GeV (template), $173.2\ ^{+4.1}_{-4.0}$ GeV (matrix element)
  - Single best measurement, better than Run I CDF+D0 measurements
- dilepton (4 methods): 2 papers will be submitted within a month

$M_{top}^{\text{CDF II combined}} = 172.2 \pm 3.7$ GeV (~2% accuracy)

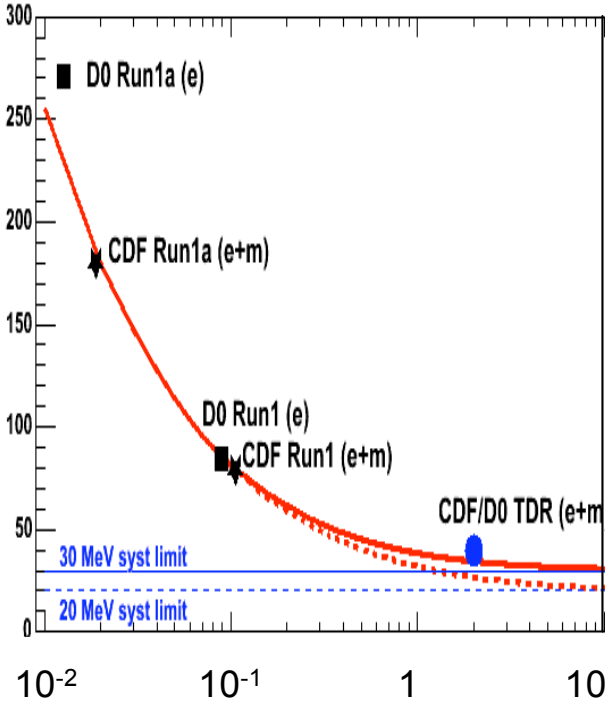
Top Mass and Production Cross-section





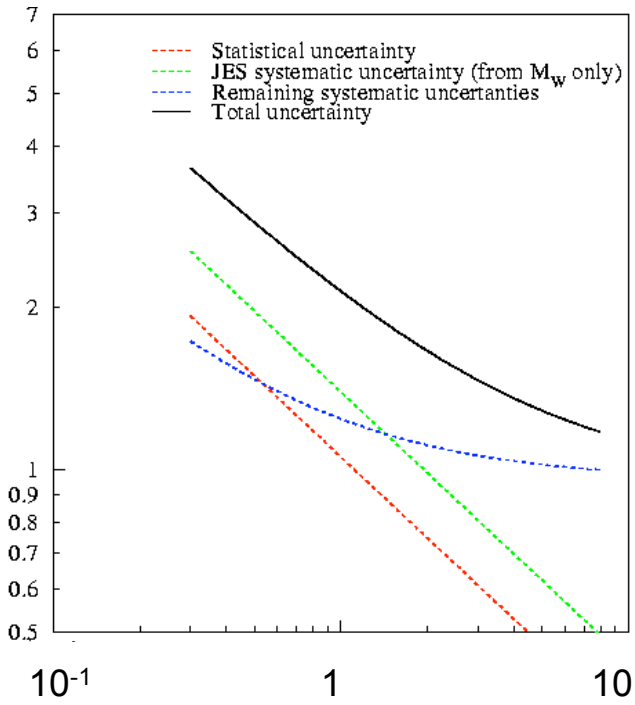
Electroweak Projections

ΔM_W [MeV]



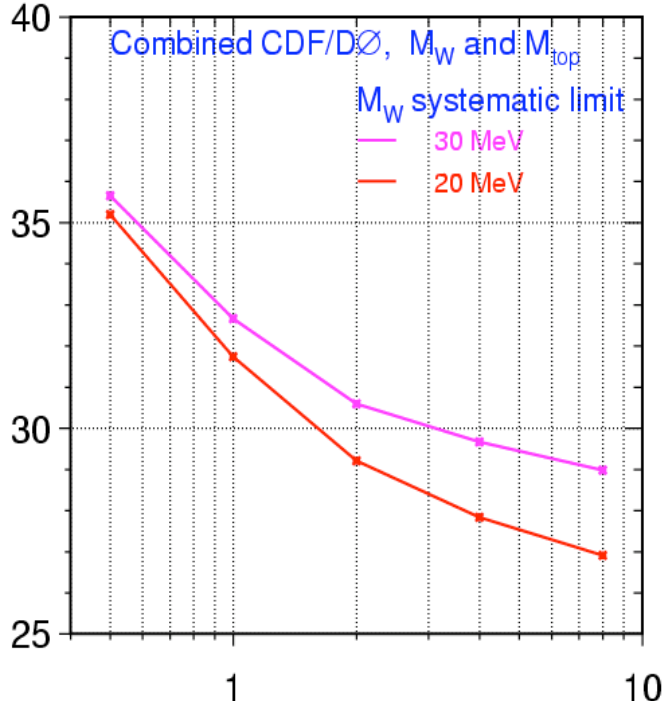
Luminosity / Experiment [fb^{-1}]

ΔM_{Top} [GeV]



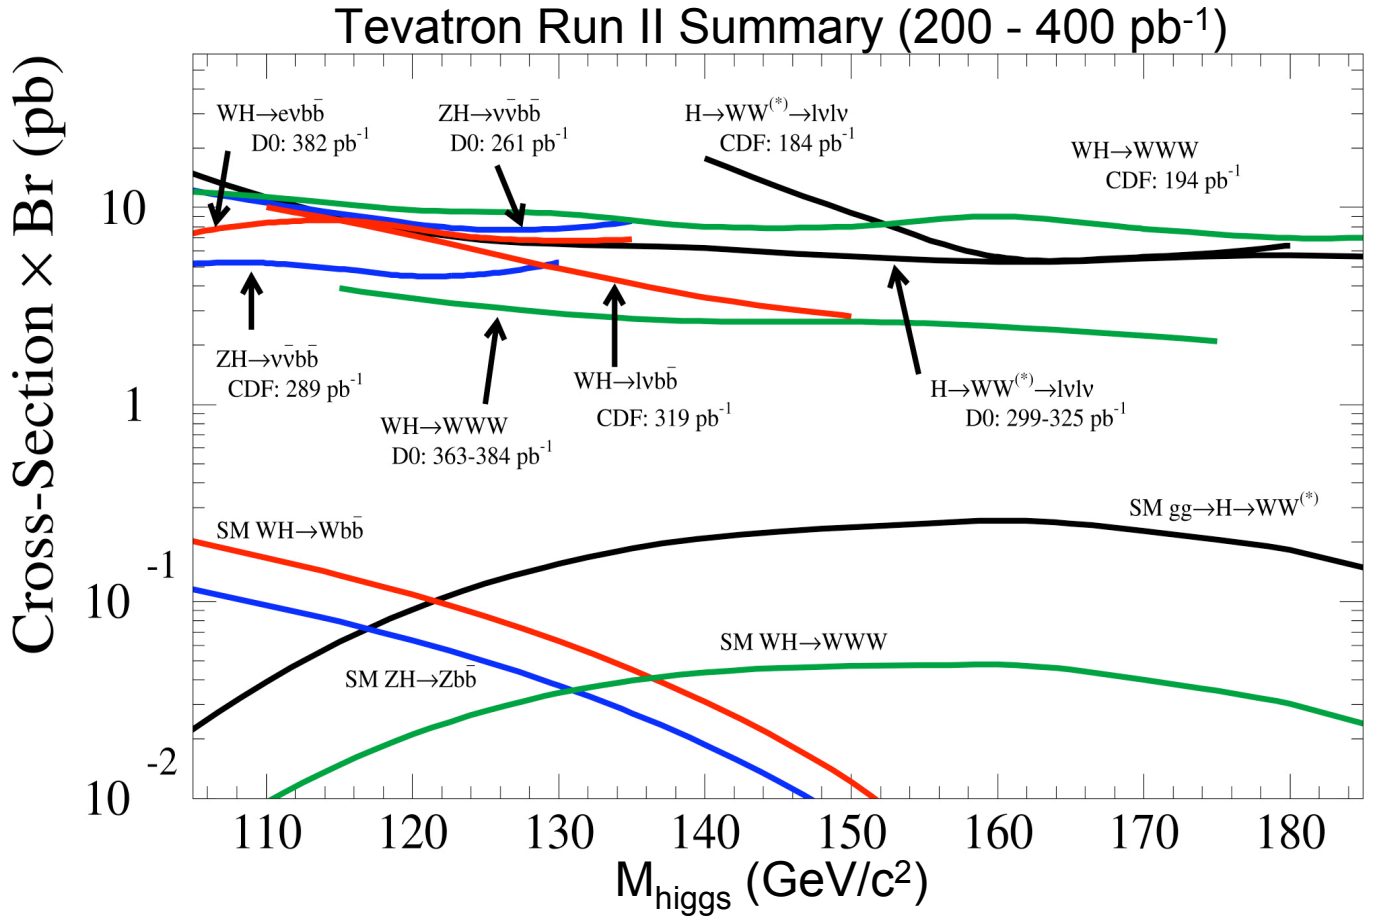
Luminosity / Experiment [fb^{-1}]

ΔM_{Higgs} / M_{higgs} [%]



Luminosity / Experiment [fb^{-1}]

Standard Model Higgs Searches

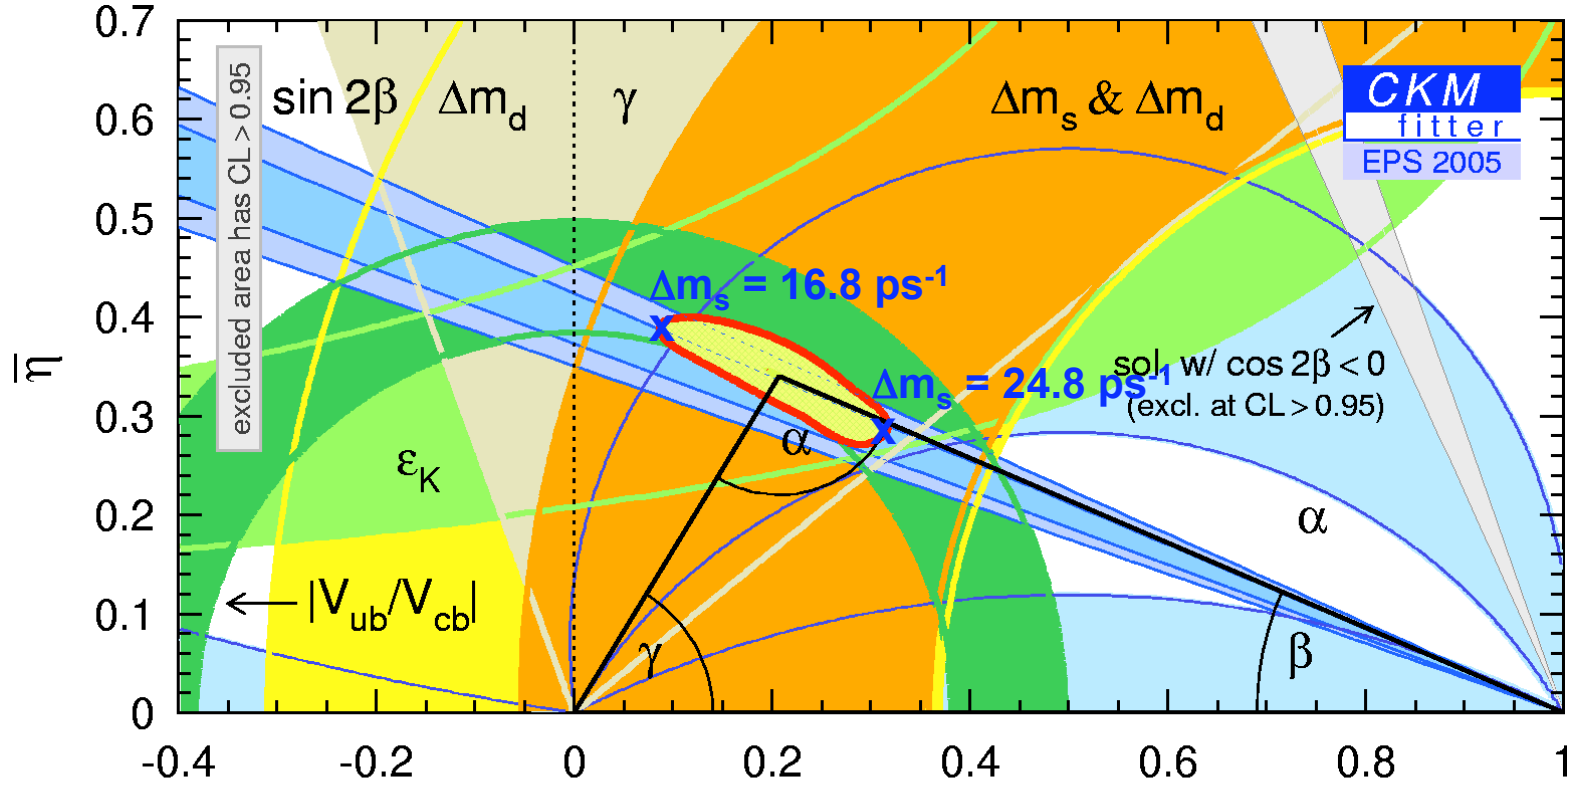


CDF currently focusing on improving sensitivities (x10):
Jet energy resolution (~70%), b-tagging acceptance (~10%) and efficiency (~50%), lepton acceptance (80~150%), analysis technique (~75%), …

We are in the half way. By summer 06, expect x5 sensitivity, x3 - x5 statistics.

Observing B_s Mixing

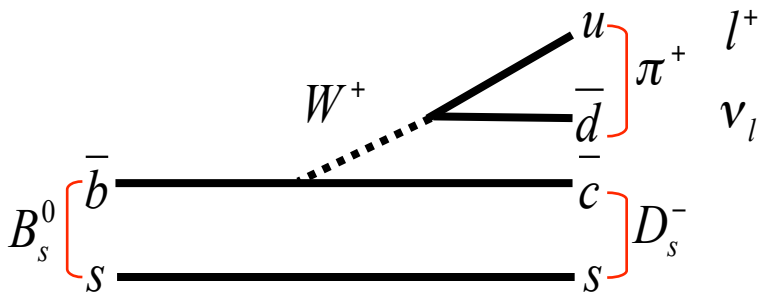
CKM Fit Result: $\Delta m_s = 18.3\ ^{+6.5}_{-1.5}\ ps^{-1}$ (1σ), $18.3\ ^{+11.4}_{-2.7}\ ps^{-1}$ (2σ)



Lower limit on Δm_s → from Δm_d

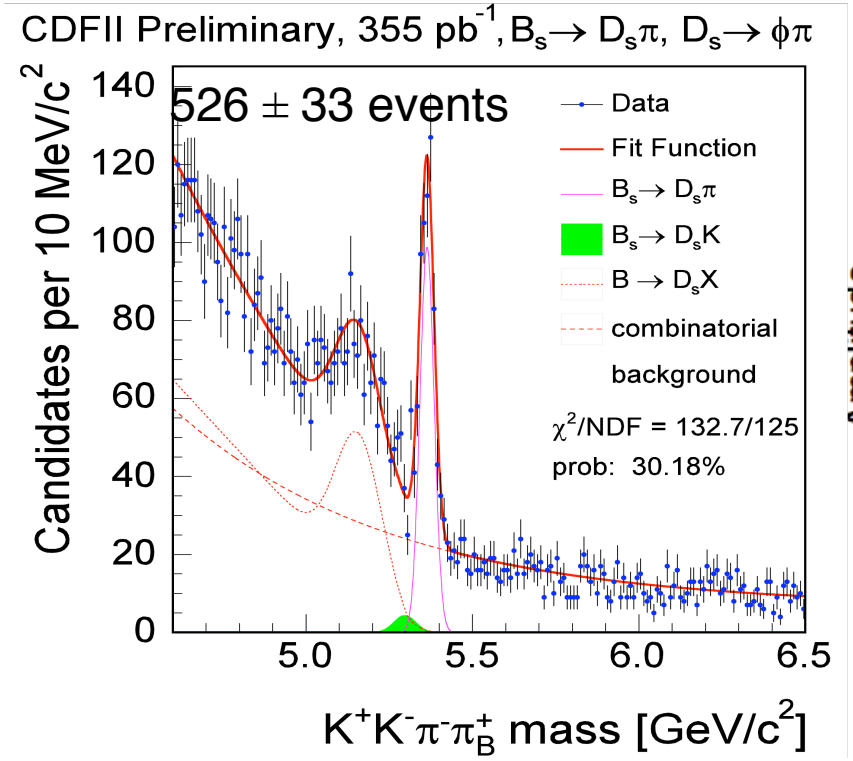
from $\Delta m_d/\Delta m_s$

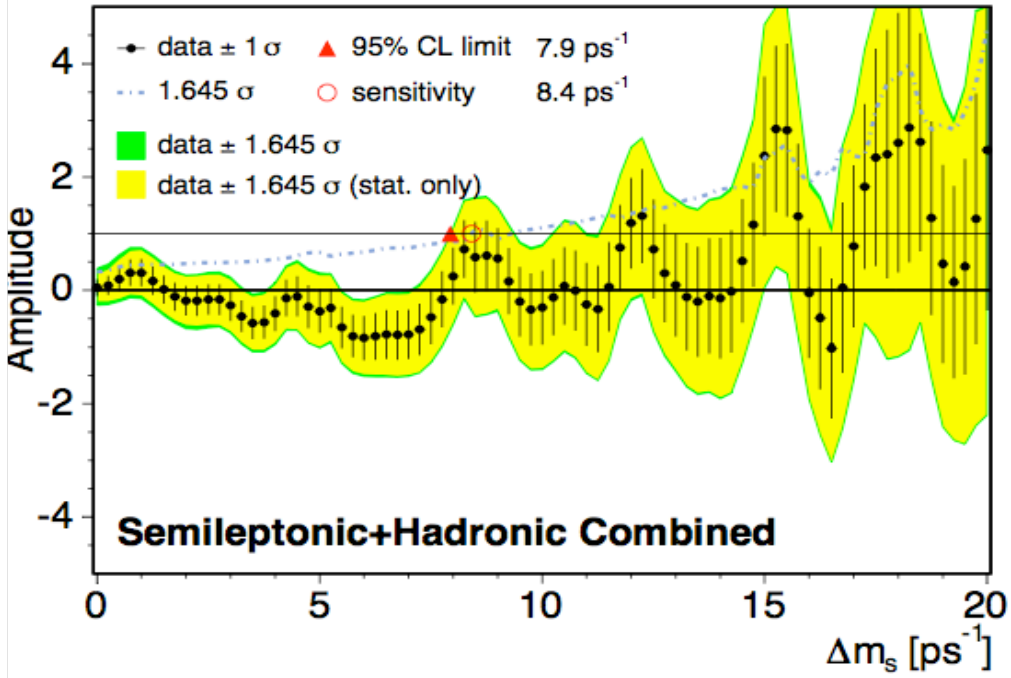
B_s Mixing Analysis: Winter 2005



~900 signal events with $B_s \rightarrow D_s\pi$, $D_s l\nu$
where $D_s \rightarrow K^*K$, $\phi\pi$, $\pi\pi\pi$

With 355 pb^{-1}
CDF 95%CL Limit: 7.9 ps^{-1}
CDF Sensitivity 8.4 ps^{-1}

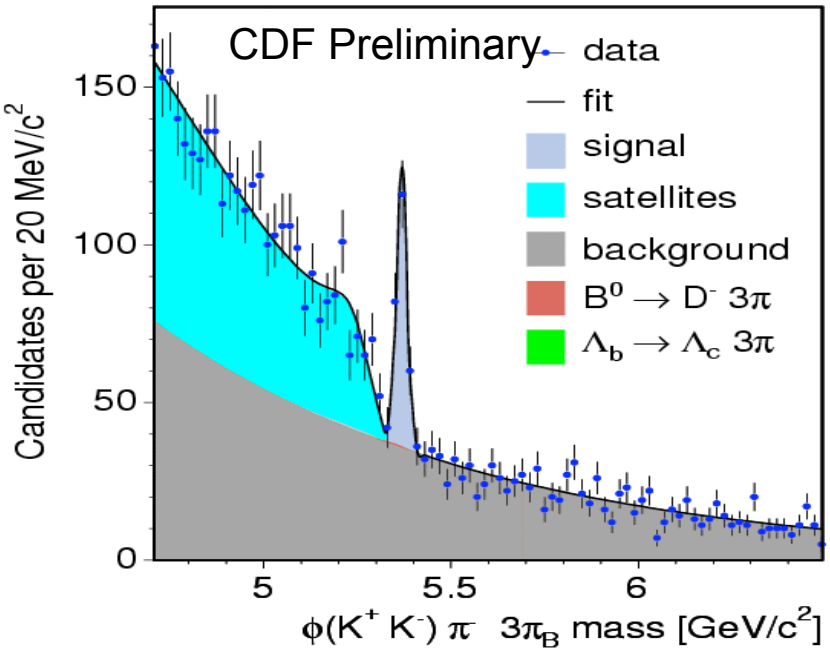


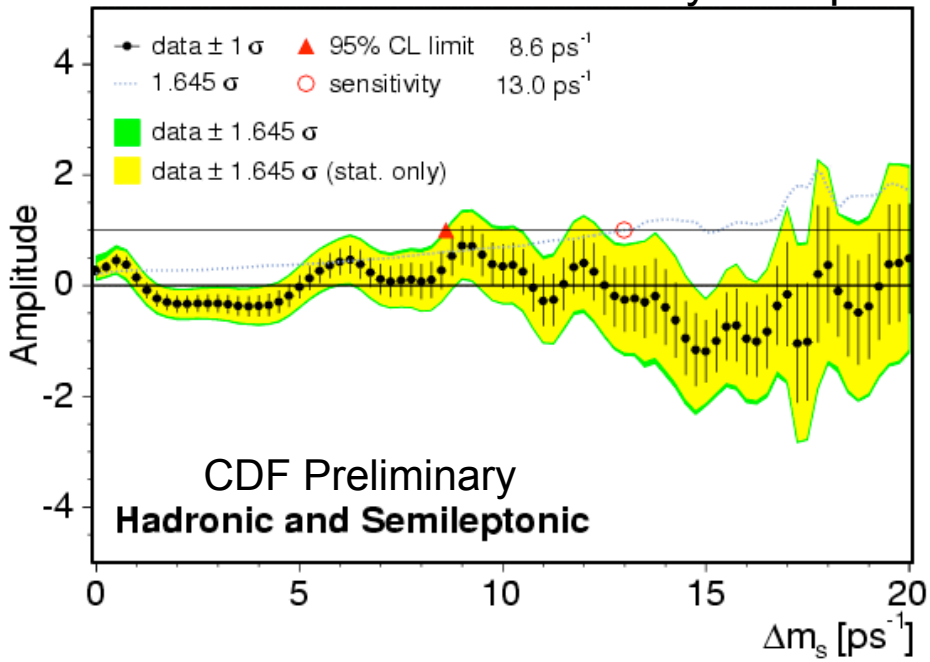


B_s Mixing Analysis: Fall 2005

- Hadronic modes
  - Improved taggers (better calibrations, NN for jet charge)
  - Improved vertex resolution (important for larger Δm_s)
  - Added a new decay mode $B_s \rightarrow D_s\, 3\pi$ (10% increase)
- Semileptonic modes
  - 2-track Silicon Vertex Trigger - x2 statistics

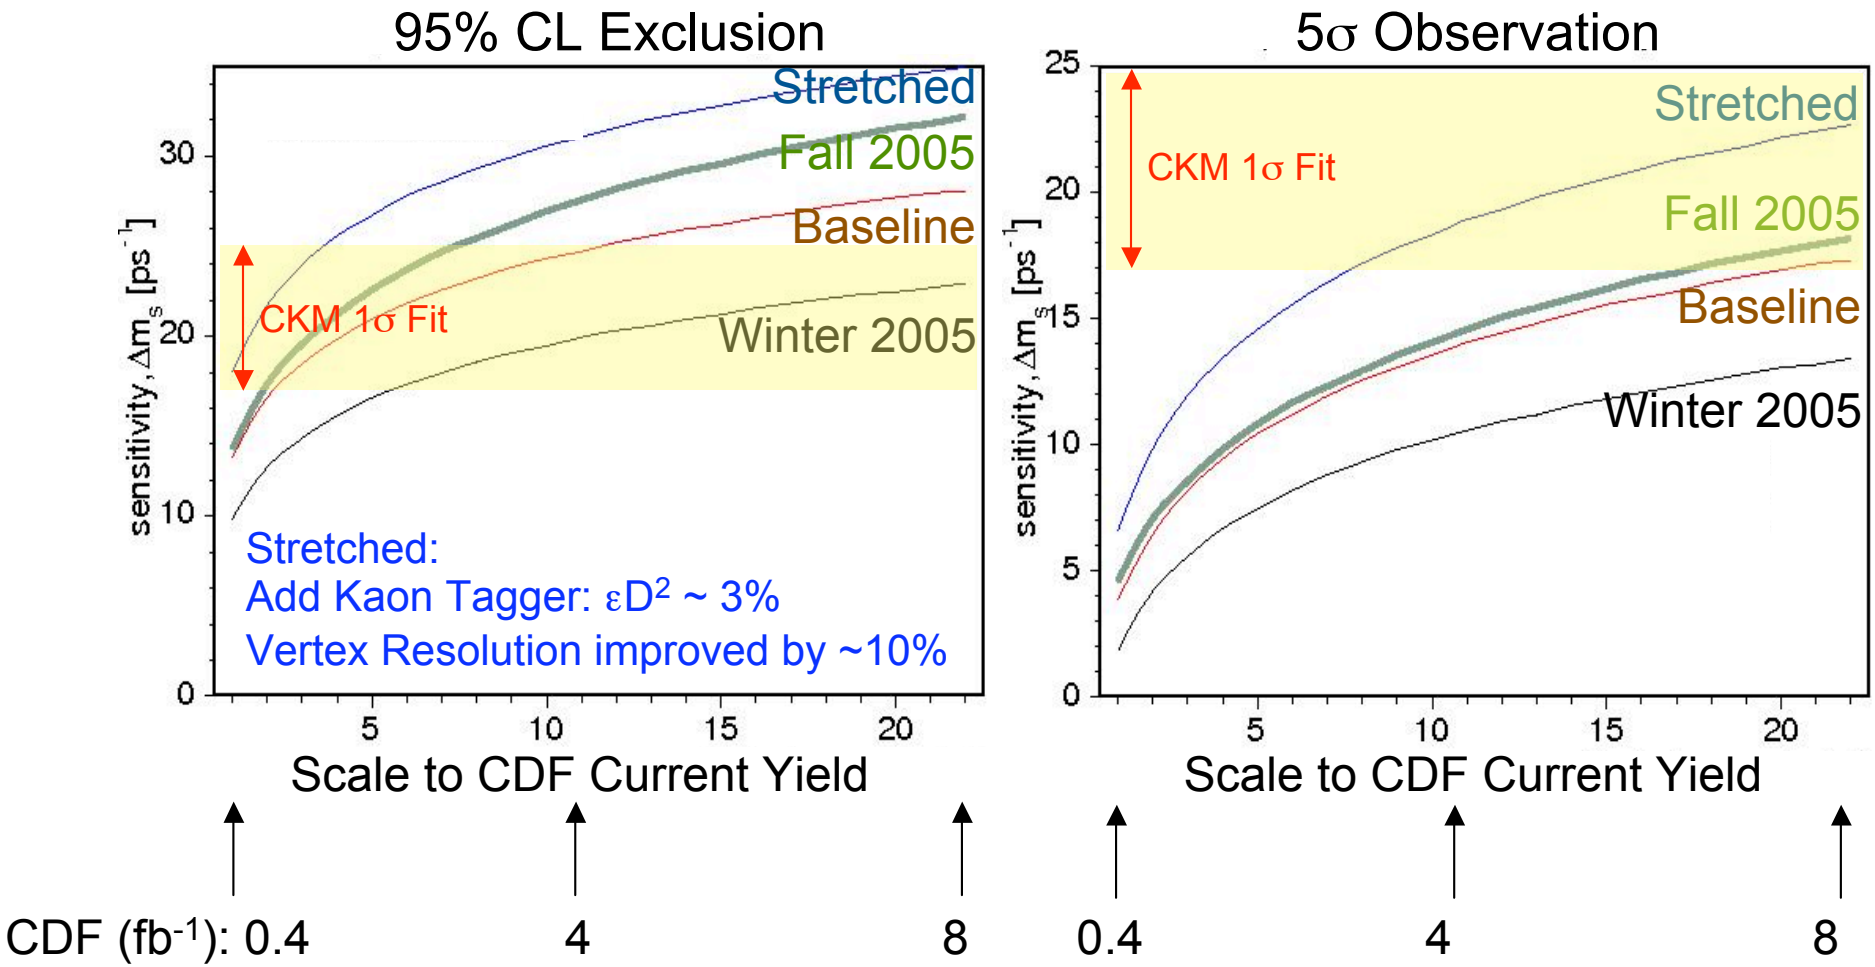
With 355 pb^{-1}
CDF 95%CL Limit: 8.6 ps^{-1}
CDF Sensitivity 13.0 ps^{-1}





With new CDF results, the world limit moved from 14.4 ps^{-1} to 16.6 ps^{-1}.

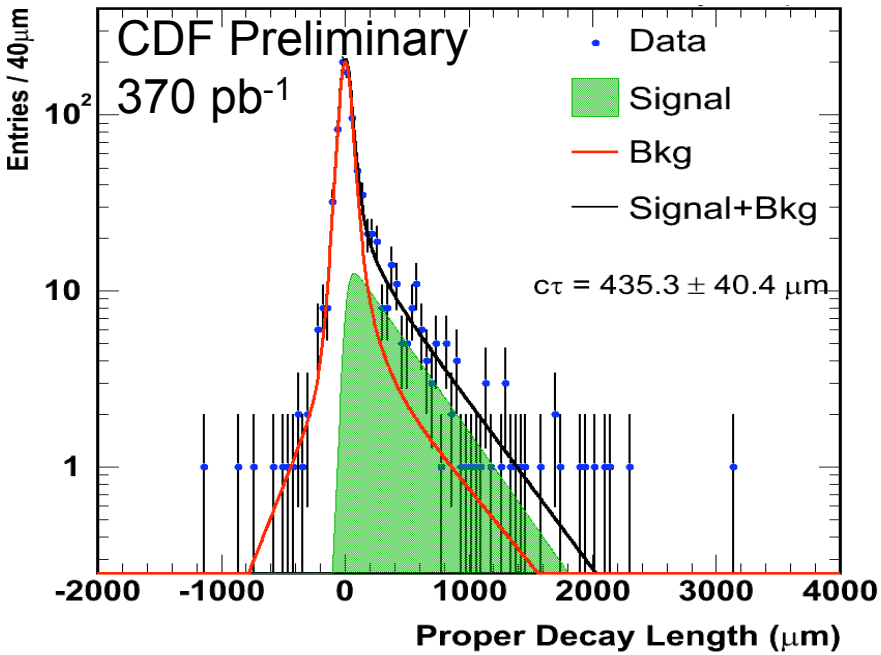
CDF Δm_s Sensitivity Projections



Sensitivity in the semileptonic mode is limited to lower values of Δm_s.
Higher values of Δm_s are only accessible in the hadronic mode.

Lifetimes

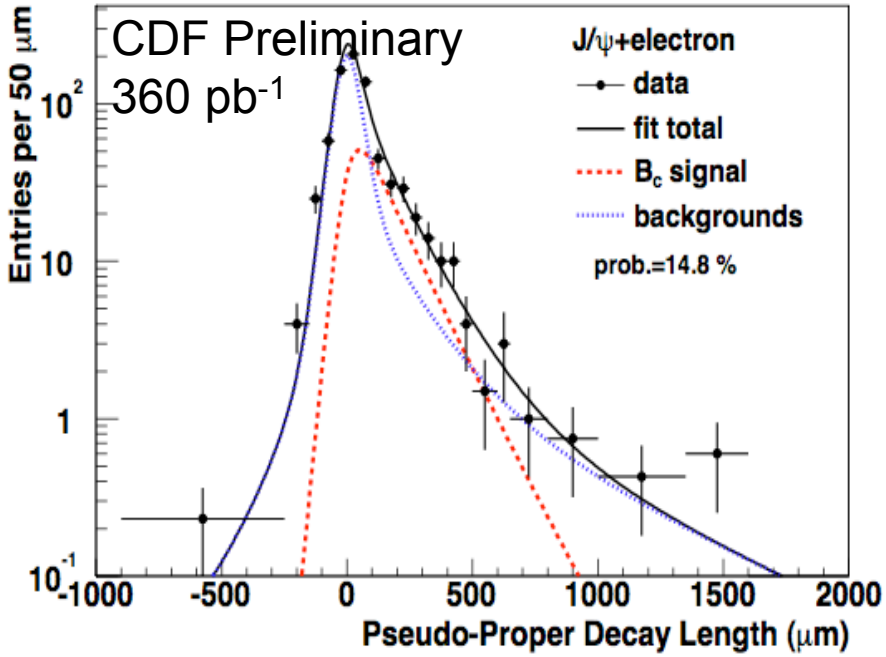
- $\Lambda_b^0 \rightarrow J/\psi\ \Lambda^0$



$\tau = 1.45 \pm 0.13 \pm 0.02$ ps

Single best measurement
in a fully reconstructed decay mode

- $B_c^0 \rightarrow J/\psi\ e\nu$



$\tau = 0.474\ ^{+0.073}_{-0.066} \pm 0.033$ ps

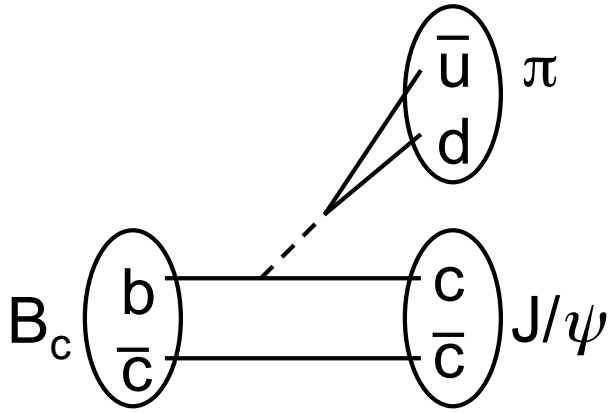
World's best

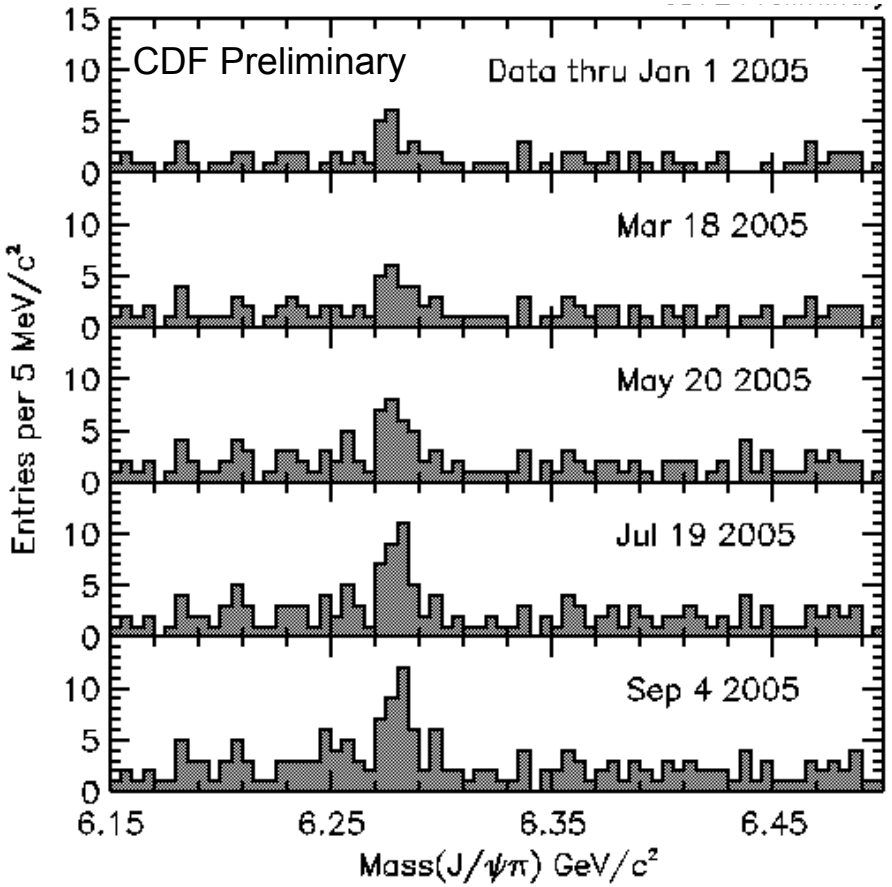
CDF are making competitive and world leading measurements
for all the heavier B hadrons.

Observation of $B_c \rightarrow J/\psi\,\pi$

Evidence with 360 pb^{-1}
hep-ex/0505076

Observation with ~800 pb^{-1}



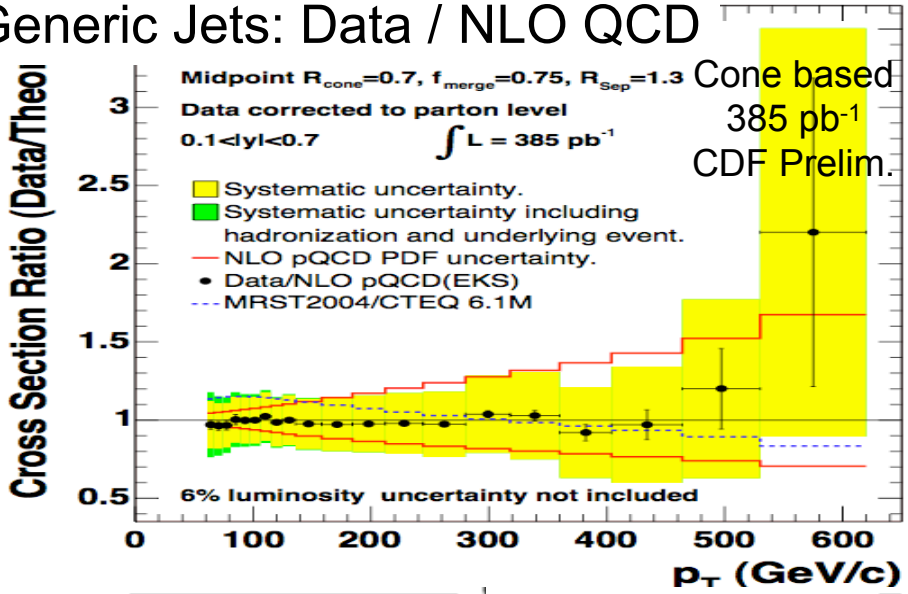


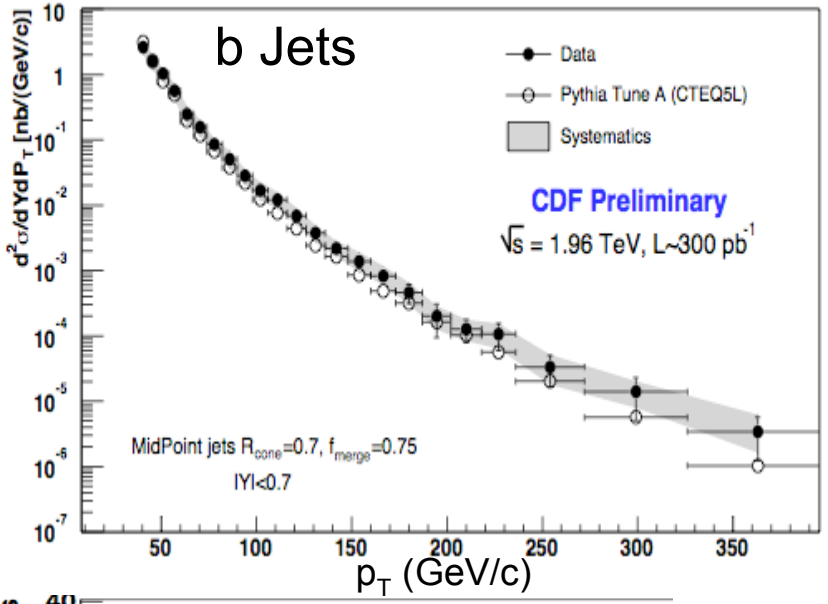
With 0.8 fb^{-1}, CDF M(B_c) = 6275.2 ± 4.3 (stat.) ± 2.5 (syst.) MeV
Lattice QCD Cal. M(B_c) = 6304 ± 12 $^{+18}_{-0}$ MeV [hep-lat/0411027]

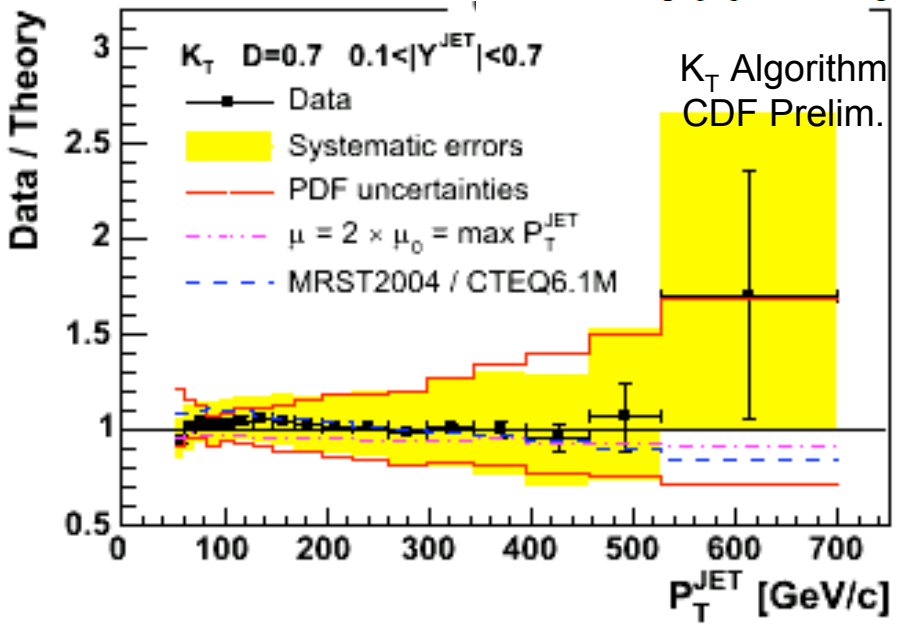
Used data up to Sept. 4, 2005 and approved as of Nov. 10, 2005.
Demonstrates physics results with data through Feb. 06 by next summer.

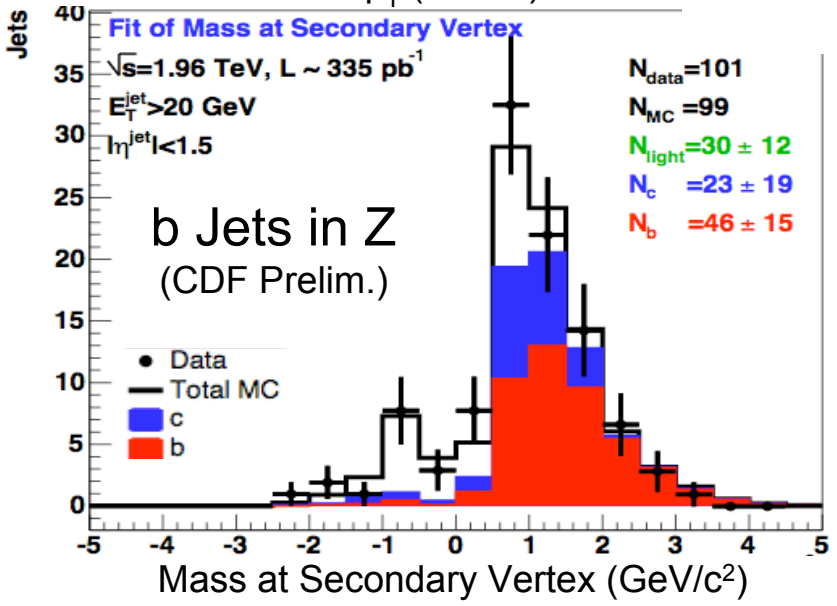
QCD Measurements

Generic Jets: Data / NLO QCD







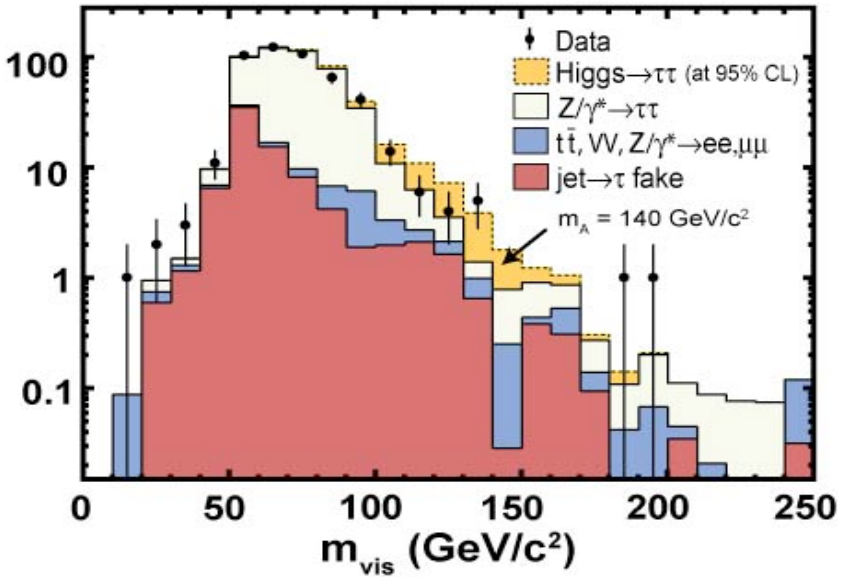


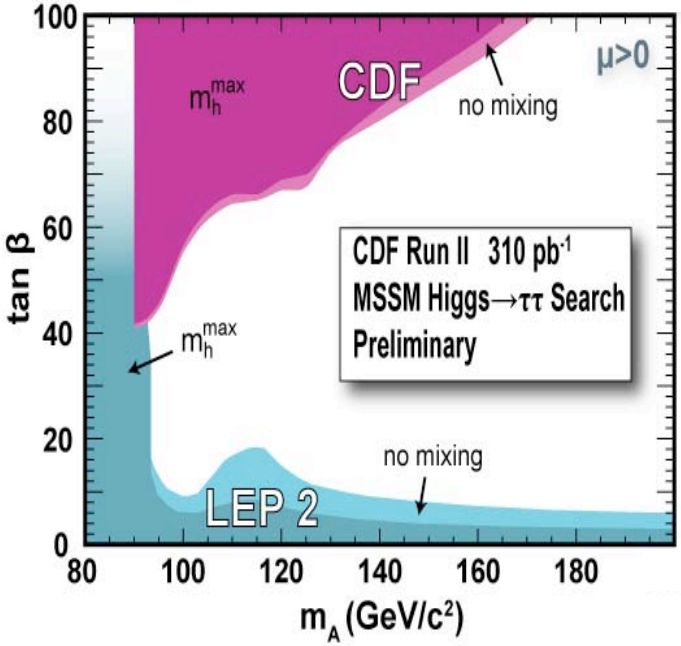
MSSM Higgs Searches

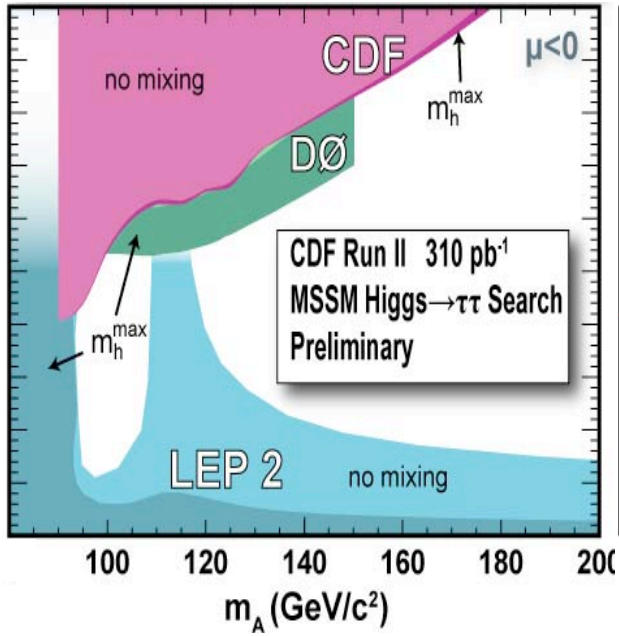
h/A/H → ττ

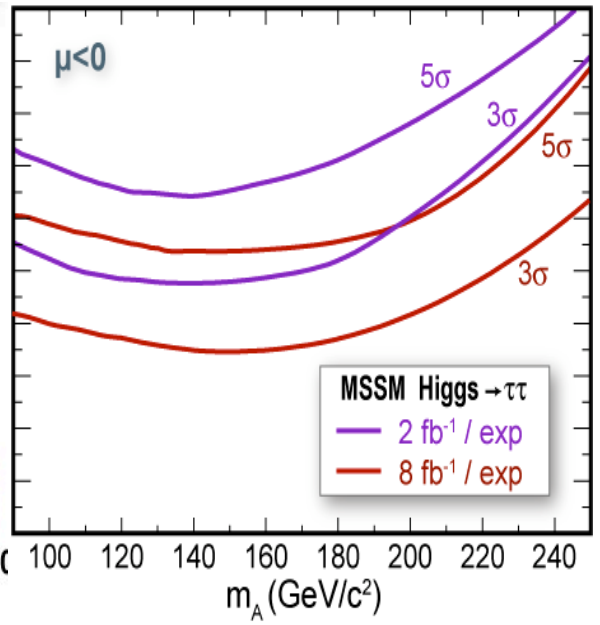
Accepted by PRL, hep-ex/0508051

$|\mu|$ = 200 GeV
M_2 = 200 GeV
$M_{gluino} = 0.8\ M_{SUSY}$
M_{SUSY} = 1 TeV, $X_t = \sqrt{6}\ M_{SUSY}$ (m_h^{max})
M_{SUSY} = 2 TeV, X_t = 0 (no-mixing)









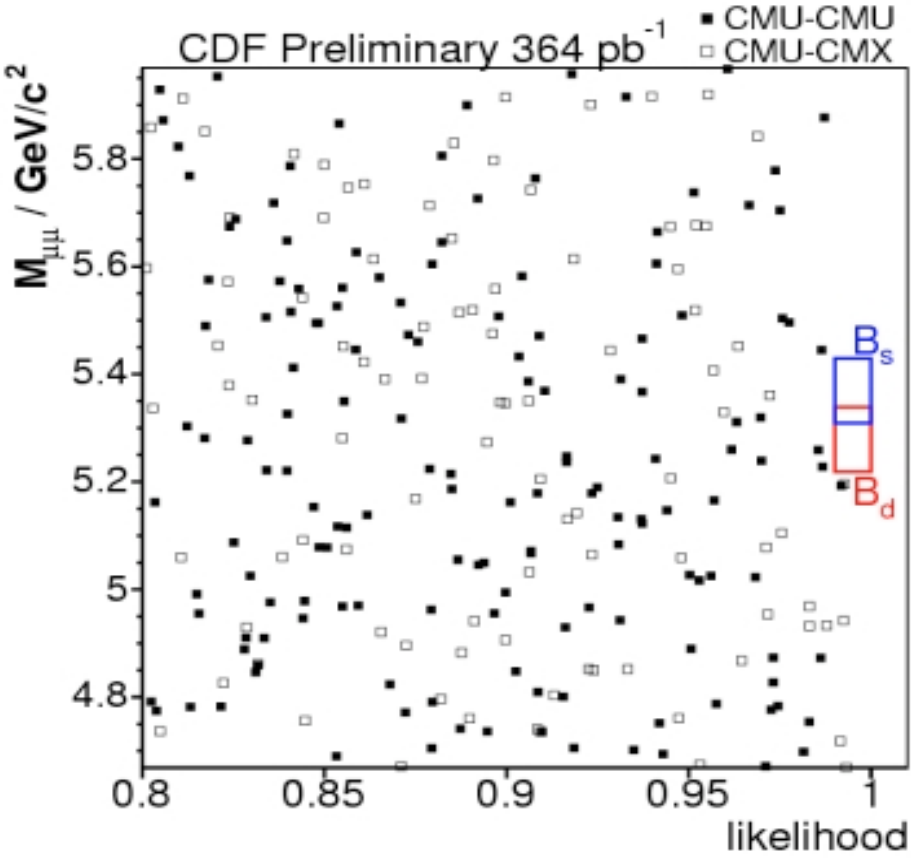
New Physics Searches via Rare Decays

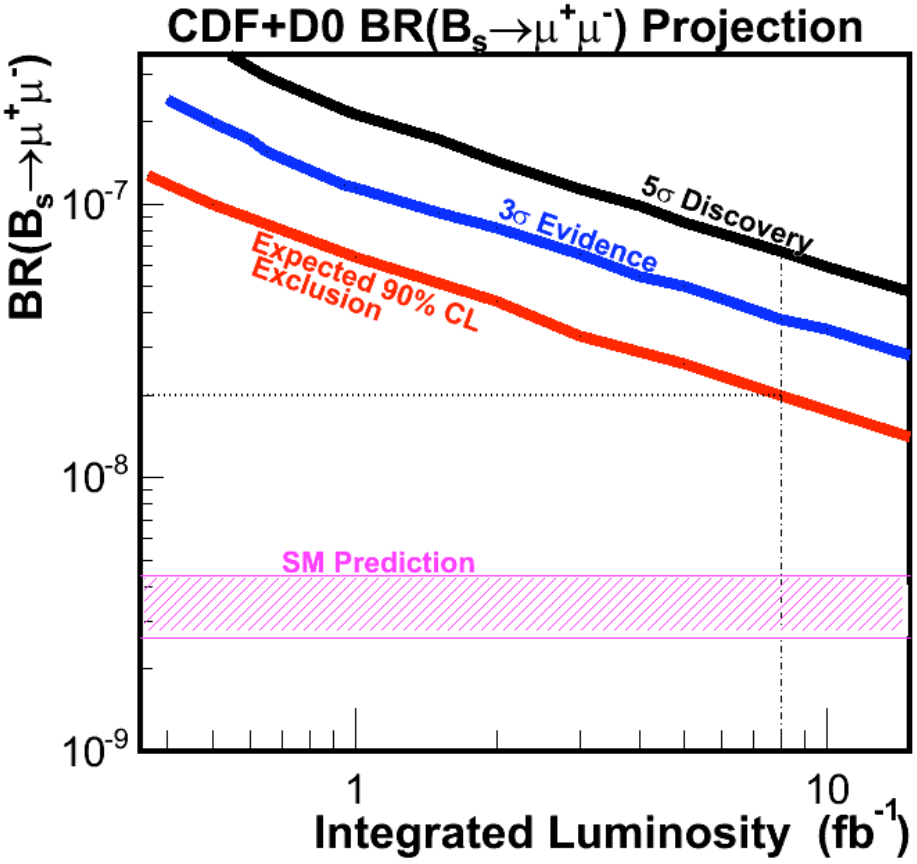
CDF Limits:

$Br(B_s \rightarrow \mu\mu) < 2.0 \times 10^{-7}$ at 95% CL - world's best

$Br(B_d \rightarrow \mu\mu) < 5.1 \times 10^{-8}$ at 95% CL - world's best

Phys. Rev. Lett. 95, 221805 (2005)





Could Find New Physics in Standard Model Samples?

Concluding Remarks

- CDF experiment is operating well. Better than ever!
  - Typical data taking efficiencies in the mid 80%'s with increasing inst. Luminosity and Run IIb commissioning
  - All detectors are in excellent conditions
  - Stable offline software
  - Established fast calibrations, data processing scheme
  - Good detector simulation
  - MC production at remote sites
- Challenging ahead…
  - x2 higher instantaneous luminosity
  - x8 higher integrated luminosity
  - Resources going down
- CDF Strategies in preparation for the future
  - Planning ahead: we have been identifying those areas that need further development and are beginning to address them immediately. Goal is to complete the work by early 2006.

Concluding Remarks

- Looking forward to Summer 2006 conferences
  - Results with x3 increase in statistics over Summer 2005
  - Report on > 10 x Run I Luminosity !!
- The upcoming years will be an exciting time with increasing statistics
  - Discovery through searches
  - Discovery through precision experiments
  - CDF Experience:
    - With ~4 pb^{-1}, Top limits set
    - With ~20 pb^{-1}, Evidence paper out!
    - With ~65 pb^{-1}, Discovery paper out!
  - Hoping for new evidence/discovery with ~1 fb^{-1}
  - New physics could appear with every factor of 3~4.
- CDF is committed to operating well and analyze the data through 2009.

Backup Slides

Tracking and High p_T Lepton Status

- COT Tracking
  - Alignment: wire positions aligned better than 10 μm
  - Efficiency: 99.6% (isolated tracks), > 96% (non-isolated tracks)

- Silicon Tracking
  - Alignment: internal - 5 μm, w.r.t. COT < 10 μm
  - Efficiency: 94% with *r*-ϕ, 83% with *r*-ϕ and *z*
  - Misidentified: 0.5% - 1.5%

- High p_T Electron Identification
  - Efficiency: 82-93%, Misidentified jets: ~10^{-4}
- High p_T Muon Identification
  - Efficiency: 93%, Misidentified jets: ~10^{-4}

- Numbers are stable with time, instantaneous luminosity up to 10^{32} $cm^{-1}s^{-1}$.

Publications: Top Physics
